

## THE DETECTION AND REMOVAL OF MICROORGANISM CONTAMINATION

### ABSTRACT OF THE DISCLOSURE

5 This invention provides novel methods for the detection of chitinous  
contaminants of non-chitinous biological materials. The methods are accurate, highly  
reproducible, rapid and relatively inexpensive. The methods are well suited to commercial  
applications, particularly in the food and agriculture industry where biological materials (*e.g.*  
food products) are regularly screened for contaminants (*e.g.* insect, mold, fungus, *etc.*). In  
one embodiment, the methods involve contacting a biological sample with a probe that is a  
10 lectin that binds chitin, contacting the sample with a pectinase; and detecting binding of said  
lectin to a chitin where the binding indicates the presence of chitin in the biological sample.
